

Homework 8 (Due at class on Nov 17)

Prob. 1 (Bosonic string on a circle)

1.1

The torus partition function of the bosonic string on a circle S^1 of radius R is given by

$$\begin{aligned} Z^{25} &= \text{Tr } q^{L_0-1/24} \bar{q}^{\tilde{L}_0-1/24}, \\ &= |\eta(q)|^{-2} \sum_{n,m} q^{\frac{\alpha'}{4} p_R^2} \bar{q}^{\frac{\alpha'}{4} p_L^2}. \end{aligned} \quad (1)$$

If we include the non-compact space $\mathbb{R}^{1,24}$, we have to multiply the partition function of the non-compact direction

$$Z^{1,24} = \text{const} \times |\eta(q)|^{-46}$$

By expanding out the Dedekind η -functions in $Z^{1,24}Z^{25}$, show that each term means the right hand sides of the mass formula and the level matching condition:

$$\begin{aligned} M^2 &= \frac{n^2}{R^2} + \frac{w^2 R^2}{\alpha'^2} + \frac{2}{\alpha'}(N + \tilde{N} - 2) \\ 0 &= nw + N - \tilde{N}. \end{aligned}$$

1.2

By using the Poisson resummation formula,

$$\sum_{n \in \mathbb{Z}} \exp(-\pi a n^2 + 2\pi i b n) = a^{-1/2} \sum_{m \in \mathbb{Z}} \exp\left[-\frac{\pi(m-b)^2}{a}\right],$$

show that (1) is modular-invariant.

1.3

Show that the partition function (1) of the theory at the self-dual radius $R = \sqrt{\alpha'}$ can be written as

$$Z^{25} = |\chi_1(q)|^2 + |\chi_2(q)|^2, \quad \text{where} \quad \chi_1 = \frac{1}{\eta} \sum_n q^{n^2} \quad \chi_2 = \frac{1}{\eta} \sum_n q^{(n+1/2)^2}$$

The χ_i are the characters of the SU(2) affine Lie algebra with level $k = 1$. By expanding this expression out find the massless states from above.

1.4

Show that the currents in the bosonic string theory defined by

$$j^\pm(z) = j^1(z) \pm i j^2(z) := e^{\pm 2i X^{25}(z)/\sqrt{\alpha'}} \quad j^3(z) := i \partial X^{25}(z)/\sqrt{\alpha'},$$

satisfy the OPEs

$$j^a(z)j^b(0) \sim \frac{\delta^{ab}}{2z^2} + \frac{i\epsilon^{abc}j^c(0)}{z}.$$

From the OPEs, show that the oscillator modes of the currents

$$j^a(z) = \sum_{m \in \mathbb{Z}} \frac{j_m^a}{z^{m+1}},$$

satisfy

$$[j_m^a, j_n^b] = \frac{m}{2} \delta_{m+n,0} \delta^{ab} + i\epsilon^{abc} j_{m+n}^c.$$

This infinite-dimensional algebra is called the **SU(2) affine Lie algebra with level $k = 1$** . (Check that the zero modes satisfy the SU(2) Lie algebra.)

Prob. 2 (RR field strengths and T-duality in Type II)

Let

$$\{\Gamma^\mu, \Gamma^\nu\} = 2\eta^{\mu\nu} \quad \mu = 0, \dots, 9$$

be the Clifford algebra of SO(1,9) gamma matrices. The gamma matrices have the following hermiticity property,

$$(\Gamma^\mu)^\dagger = -\Gamma^0 \Gamma^\mu (\Gamma^0)^{-1}.$$

Verify that the chirality matrix

$$\Gamma^{11} = \Gamma^0 \Gamma^1 \cdots \Gamma^9,$$

satisfies

$$\Gamma^2 = 1, \quad \{\Gamma^{11}, \Gamma^\mu\} = 0.$$

Chiral spinors are now defined by

$$\Gamma^{11} \psi_\pm = \pm \psi_\pm, \tag{2}$$

Show that

$$\bar{\psi}_\pm \Gamma^{11} = \mp \bar{\psi}_\pm$$

where $\bar{\psi}_\pm = \psi_\pm^\dagger \Gamma^0$.

We define the RR field strengths $G^{\mu_1 \cdots \mu_{p+1}}$ as spinor bilinears

$$\text{IIA : } \bar{\psi}_-^R \Gamma^{\mu_1 \cdots \mu_{p+1}} \psi_+^L, \quad \text{IIB : } \bar{\psi}_+^R \Gamma^{\mu_1 \cdots \mu_{p+1}} \psi_+^L, \tag{3}$$

where ψ^R (ψ^L) comes from the right (left) movers and

$$\Gamma^{\mu_1 \cdots \mu_{p+1}} = \Gamma^{[\mu_1} \cdots \Gamma^{\mu_{p+1}]}$$

is the antisymmetric product of $(p+1)$ gamma matrices. Using the chirality (2) of the spinors, determine for which values of p the RR field strengths (3) are non-zero.

In the lecture, we learn that T-duality of the 9th direction in Type II theory acts the left-moving fermion mode

$$\tilde{\psi}_n^9 \rightarrow -\tilde{\psi}_n^9, \quad n \in \mathbb{Z}.$$

The action of duality on the spinor fields is of the form

$$\psi^R \rightarrow \psi^R, \quad \psi^L \rightarrow \beta_9 \psi^L \quad (4)$$

where $\beta_9 = \Gamma^9 \Gamma^{11}$. Show that

$$\{\beta_9, \Gamma^9\} = 0, \quad [\beta_9, \Gamma^\mu] = 0, \quad \text{for } \mu \neq 9.$$

Using the effect of (4) on the RR field strengths (3), show that T-duality transforms the RR field strengths in IIA to those in IIB, and vice versa.

Prob. 3 (D-branes in Type II and T-duality)

Two D-branes intersect orthogonally over a p -brane if they share p directions with the remaining directions wrapping different directions. For example a D5-brane extending in the directions x^0, x^1, \dots, x^5 and a D3-brane extending in x^0, x^1, x^2, x^6 intersect orthogonally over an 2-brane x^0, x^1, x^2 .

	0	1	2	3	4	5	6	7	8	9
D3	×	×	×				×			
D5	×	×	×	×	×	×				

In such cases we can divide the spacetime directions into 4 sets, NN, ND, DN, DD according to whether the coordinate X^μ has Neumann (N) or Dirichlet (D) boundary conditions on the first or second brane. In the example of the D3-D5 system for a string stretching from the D3-brane to the D5-brane: NN = $\{x^0, x^1, x^2\}$, ND = $\{x^6\}$, DN = $\{x^3, x^4, x^5\}$, DD = $\{x^7, x^8, x^9\}$.

3.1

Show that the numbers (<#NN+#DD>) and (<#ND+#DN>) are invariant under T-duality, where #NN is the number of NN directions, etc.

3.2

List all orthogonal intersections in IIB string theory that have (<#ND+#DN>) = 4 and contain at least one D3-brane. Show that all these configurations are T-dual to the following D1-D5 configuration:

	0	1	2	3	4	5	6	7	8	9
D1	×	×								
D5	×	×	×	×	×	×
